1. Concrete clear cover for reinforcement bars shall be 2" minimum, unless noted otherwise.

2. Barrier contraction joints over existing pavement. Contraction joints shall be separated by open joints having the same width as the pavement joints for the full exposed surface of the barrier.

3. Barrier contraction joints shall be a groove 1/2" wide and 1/2" deep, sawed or formed across the top and along the sides for the entire surface of the barrier, or a full depth butt joint, at approximately 10'-0" to 20'-0" intervals along the length of the barrier. In addition, these grooved or butt joints shall be transversely aligned, with the contraction joints in abutting concrete pavement.

4. Expansion joints shall be placed in the barrier at structures and other expansion joints in abutting concrete pavement, over existing expansion joints in the underlying concrete pavement, and locations as shown on the plans or as directed by the engineer. At expansion joints, barrier sections shall be 1/8" apart and the opening filled, for the entire length and depth of the joint with 1/8' preformed joint filler which complies with the requirements of Section 1042 of the standard specifications. The filler shall be recessed 1/8" in from the sides and top of the barrier.

5. At each end of the barrier installations, the barrier shall be adequately terminated in accordance with the contract documents.

6. For slip forming construction, the 6B2E and 5B4E bars shall be placed as one continuous piece. The bars shall lap a minimum of 3'-5 1/2" and 2'-10 1/2" respectively.

7. For slip forming construction, a control joint shall be cut in the barrier every 10'-0" at a maximum depth of 1".

8. Diagonal No. 4 bars only when using slip-form construction. Diagonal No. 4 bars not shown in section view.

9. Depth of GABC to match roadway base, 8" minimum.

10. This barrier to be only be used on Interstates, Freeways and Expressways.

NOTES:

1. Concrete clear cover for reinforcement bars shall be 2" minimum, unless noted otherwise.

2. Barrier contraction joints over existing pavement. Contraction joints shall be separated by open joints having the same width as the pavement joints for the full exposed surface of the barrier.

3. Barrier contraction joints shall be a groove 1/2" wide and 1/2" deep, sawed or formed across the top and along the sides for the entire surface of the barrier, or a full depth butt joint, at approximately 10'-0" to 20'-0" intervals along the length of the barrier. In addition, these grooved or butt joints shall be transversely aligned, with the contraction joints in abutting concrete pavement.

4. Expansion joints shall be placed in the barrier at structures and other expansion joints in abutting concrete pavement, over existing expansion joints in the underlying concrete pavement, and locations as shown on the plans or as directed by the engineer. At expansion joints, barrier sections shall be 1/8" apart and the opening filled, for the entire length and depth of the joint with 1/8' preformed joint filler which complies with the requirements of Section 1042 of the standard specifications. The filler shall be recessed 1/8" in from the sides and top of the barrier.

5. At each end of the barrier installations, the barrier shall be adequately terminated in accordance with the contract documents.

6. For slip forming construction, the 6B2E and 5B4E bars shall be placed as one continuous piece. The bars shall lap a minimum of 3'-5 1/2" and 2'-10 1/2" respectively.

7. For slip forming construction, a control joint shall be cut in the barrier every 10'-0" at a maximum depth of 1".

8. Diagonal No. 4 bars only when using slip-form construction. Diagonal No. 4 bars not shown in section view.

9. Depth of GABC to match roadway base, 8" minimum.

10. This barrier to be only be used on Interstates, Freeways and Expressways.
