2009 MUTCD Format Revisions

- Paragraphs are numbered
- Guidance is italicized
- No more metric
- Definitions relocated to Part 1

Standards:

13 In cases where irregular street design necessitates placing signals with a comparatively small angle between their respective signal indicators, it shall, to the extent practical, be visibility-limited by signal visors, sina approaching road user’s view of the signal indication(s) controlling traffic is minimized.

14 Signal visors exceeding 12 inches in length shall not be used on the

Guidance:

15 Signal visors should be used on signal faces to aid in directing the signal approaching traffic, as well as to reduce “sun phantom,” which can result in a

16 The use of signal visors, or the use of signal faces or devices that direct their intensity, should be considered as an alternative to signal lowers because of signal lowers.

Option:

17 Special signal faces, such as visibility-limited signal faces, may be used for the signal indications intended for other approaches before seeing the signal. Simultaneous viewing of both signal indications could cause the road use
Section 1A.13 Definitions of Headings, Words, and Phrases in this Manual

Standard:
When used in this Manual, the text headings of Standard, Guidance, Option, and Support shall be defined as follows:

A. Standard—a statement of required, mandatory, or specifically prohibitive practice regarding a traffic control device. All Standard statements are labeled, and the text appears in bold type. The verb “shall” is typically used. The verbs “should” and “may” are not used in Standard statements. Standard statements are sometimes modified by Options. Standard statements shall not be modified or compromised based on engineering judgment or engineering study.

B. Guidance—a statement of recommended, but not mandatory, practice in typical situations, with deviations allowed if engineering judgment or engineering study indicates the deviation to be appropriate. All Guidance statements are labeled, and the text appears in unbold type. The verb “should” is typically used. The verbs “shall” and “may” are not used in Guidance statements. Guidance statements are sometimes modified by Options.

C. Option—a statement of practice that is a permissive condition and carries no requirement or recommendation. Option statements sometime contain allowable modifications to a Standard or Guidance statement. All Option statements are labeled, and the text appears in unbold type. The verb “may” is typically used. The verbs “shall” and “should” are not used in Option statements.

D. Support—an informational statement that does not convey any degree of mandate, recommendation, authorization, prohibition, or enforceable condition. Support statements are labeled, and the text appears in unbold type. The verbs “shall,” “should,” and “may” are not used in Support statements.

- **Standards are requirements that **SHALL** be followed unless there is an Option**
- **Guidance is recommended and **SHOULD** be followed**
- **Options **MAY** be followed and are sometimes modifications to Standards and Guidance**
Location: Unknown
(hopefully not in Delaware!)
• **New Chapters**
  - Pedestrian Hybrid Beacons (Chapter 4F)
  - Highway Traffic Signals at Toll Plazas (Chapter 4K)

• **Many New Sections & Lots of Reorganization within Chapters**
  - Will be discussed throughout presentation

• **Very few Delaware Revisions**
PART 4 TRAFFIC SIGNALS

- 4A: General
- 4B: Traffic Control Signals - General
- 4C: Traffic Control Signal Needs Studies
- 4D: Traffic Control Signal Features
- 4E: Pedestrian Control Features
- 4F: Pedestrian Hybrid Beacons (New)
- 4G: Traffic Control Signals and Hybrid Beacons for Emergency-Vehicle Access
- 4H: Traffic Control Signals for One-Lane, Two-Way Facilities
- 4I: Traffic Control Signals for Freeway Entrance Ramps
- 4J: Traffic Control for Movable Bridges
- 4K: Highway Traffic Signals at Toll Bridges (New)
- 4L: Flashing Beacons
- 4M: Lane-Use Control Signals
- 4N: In-Roadway Lights
Location: Melbourne, Australia
Guidance: **DRAFT**

05 **(DE Revision)** If the engineering study indicates that the traffic control signal is no longer justified, and a decision is made to remove the signal, removal should be accomplished using the following steps:

A. Determine the appropriate traffic control to be used after removal of the signal.
B. Remove any sight-distance restrictions as necessary.
C. Inform the public of the removal study. **A SIGNAL UNDER STUDY FOR REMOVAL (D12-6-DE) sign** (see Figure 21-8) should be installed at an intersection to inform motorists of the potential removal of an existing traffic signal.
D. Flash or cover the signal heads for a minimum of 90 days, and install the appropriate stop control or other traffic control devices.
E. Remove the signal if the engineering data collected during the removal study period confirms that the signal is no longer needed.

Revised Guidance

- **Procedures for removing a traffic signal changed from Option to Guidance**

**DE Revision:**

- **A SIGNAL UNDER STUDY FOR REMOVAL (D12-6-DE) sign should be installed**
Chapter 4C – TRAFFIC CONTROL SIGNAL NEEDS STUDIES

INTERSECTION EPIC FAIL
Section 4C.04 – Warrant 3, Peak Hour

Option:

05. If this warrant is the only warrant met and a traffic control signal is justified by an engineering study, the traffic control signal may be operated in the flashing mode during the hours that the volume criteria of this warrant are not met.

Guidance:

06. If this warrant is the only warrant met and a traffic control signal is justified by an engineering study, the traffic control signal should be traffic-actuated.

New Option and Guidance (similar to provisions for Warrants 4 and 5)

• When only Warrant 3 is met:
  • Signal may be operated in flashing mode during off-peak
  • Signal should be traffic-actuated

Note: While not modified in MUTCD, in DE, signals should operate full-time.

(DeIDOT in the process of converting signal to full-time...)

Walther Ave. at Barrett Run
Standard:

The need for a traffic control signal at an intersection or midblock crossing shall be considered if an engineering study finds that one of the following criteria is met:

A. For each of any 4 hours of an average day, the plotted points representing the vehicles per hour on the major street (total of both approaches) and the corresponding pedestrians per hour crossing the major street (total of all crossings) all fall above the curve in Figure 4C-5; or

B. For 1 hour (any four consecutive 15-minute periods) of an average day, the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding pedestrians per hour crossing the major street (total of all crossings) falls above the curve in Figure 4C-7.

**Significant Change in Criteria**

- **Warrant met with plotted points of Four-Hour OR Peak Hour pedestrian and vehicle volumes**
- Previously, both had to be met
Option:

03 If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 35 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, Figure 4C-6 may be used in place of Figure 4C-5 to evaluate Criterion A in Paragraph 2, and Figure 4C-8 may be used in place of Figure 4C-7 to evaluate Criterion B in Paragraph 2.

07 The criterion for the pedestrian volume crossing the major street may be reduced as much as 50 percent if the 15th-percentile crossing speed of pedestrians is less than 3.5 feet per second.

Additional Options

• If speeds exceed 35 mph, a 70% factor reduction of Four-Hour and Peak Hour criteria may be used
• Pedestrian volume criteria may be reduced up to 50% if 15th-percentile speed of pedestrians is 3.5 s or less

**Net Effect of Warrant 4 Changes:**

*Warrant 4 is now slightly easier to meet with lower pedestrian volumes but slightly more difficult to meet with low vehicle volumes*
Example of a site that did not meet old warrants but did meet the new ped warrant

SR 299 & Middletown H.S.
Additional Guidance – Sections 4C.05 & 4C.06

- **Signals installed at intersections based only on Warrants 4 or 5 should also control the minor street or driveway**

A.I. duPont Middle School @ Hopeton Rd
Additional Guidance – Sections 4C.05 & 4C.06

- **Signalized mid-block pedestrian crossings should be:**
  - >100’ from any STOP or YIELD controlled approach
  - Pedestrian actuated
  - Designed with adequate SD, through curb extensions or other techniques
  - Coordinated with adjacent signals if on an actuated corridor
New Warrant 9 – Intersection Near a Grade Crossing

- Warrant 9 is intended for locations where:
  - No other signal warrants are met
  - Proximity of the intersection to a grade crossing is the principal reason to consider a traffic signal
Guidance:

This signal warrant should be applied only after adequate consideration has been given to other alternatives or after a trial of an alternative has failed to alleviate the safety concerns associated with the grade crossing. Among the alternatives that should be considered or tried are:

A. Providing additional pavement that would enable vehicles to clear the track or that would provide space for an evasive maneuver, or
B. Reassigning the stop controls at the intersection to make the approach across the track a non-stopping approach.

New Warrant 9 – Intersection Near a Grade Crossing

- Warrant 9 should be applied only after alternatives such as providing additional pavement or re-assigning stop controls at the intersection have been considered
Section 4C.10 – Warrant 9, Intersection Near a Grade Crossing

Standard:

The need for a traffic control signal shall be considered if an engineering study finds that both of the following criteria are met:

A. A grade crossing exists on an approach controlled by a STOP or YIELD sign and the center of the track nearest to the intersection is within 140 feet of the stop line or yield line on the approach; and

B. During the highest traffic volume hour during which rail traffic uses the crossing, the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the minor-street approach that crosses the track (one direction only, approaching the intersection) falls above the applicable curve in Figure 4C-9 or 4C-10 for the existing combination of approach lanes over the track and the distance D, which is the clear storage distance as defined in Section 1A.13.

New Warrant 9 – Intersection Near a Grade Crossing

- **A traffic signal shall be considered if both of the following conditions are met:**
  - Grade crossing is within 140 feet of stop or yield line of nearby intersection
  - Plotted point is higher than applicable curve in Figure 4C-9 or 4C-10
Considerations for plotting on Figure 4C-9 and 4C-10

- Highest Major and Minor Street traffic volumes when rail traffic uses the crossing
  
  *If rail traffic arrival times are unknown, the highest traffic volume hour of the day should be used*

- Clear Storage Distance between track and Major Street
Section 4C.10 – Warrant 9, Intersection Near a Grade Crossing

Option:

Because the curves are based on an average of four occurrences of rail traffic per day, the vehicles per hour on the minor-street approach may be multiplied by the adjustment factor shown in Table 4C-2 for the appropriate number of occurrences of rail traffic per day.

Because the curves are based on typical vehicle occupancy, if at least 2% of the vehicles crossing the track are buses carrying at least 20 people, the vehicles per hour on the minor-street approach may be multiplied by the adjustment factor shown in Table 4C-3 for the appropriate percentage of high-occupancy buses.

Because the curves are based on tractor-trailer trucks comprising 10% of the vehicles crossing the track, the vehicles per hour on the minor-street approach may be multiplied by the adjustment factor shown in Table 4C-4 for the appropriate distance and percentage of tractor-trailer trucks.

- Minor-street approach volume may be adjusted by up to 3 factors:
  1. Daily frequency of rail traffic
  2. Percentage of high-occupancy buses
  3. Percentage of tractor-trailer trucks

Section 4C.10 – Warrant 9, Intersection Near a Grade Crossing

Standard:
09  If this warrant is met and a traffic control signal at the intersection is justified by an engineering study, then:
   A. The traffic control signal shall have actuation on the minor street;
   B. Preemption control shall be provided in accordance with Sections 4D.27, 8C.09, and 8C.10; and
   C. The grade crossing shall have flashing-light signals (see Chapter 8C).

Guidance:
10  If this warrant is met and a traffic control signal at the intersection is justified by an engineering study, the grade crossing should have automatic gates (see Chapter 8C).

- Traffic signals justified by Warrant 9 shall have:
  - Actuation on minor street
  - Train preemption control
  - Flashing-light signals

- Automatic gates should be installed
This light always takes forever.
I'd like to smack the idiot who designed this intersection.

Hi.
Who the hell are you?
I designed this intersection.

You're right—I should have just made the light shorter! Never mind the hours of simulation and testing I did. Never mind that this intersection interacts with its neighbors in a complicated way and it took me a week to work out timing sequences that avoided total jams.

Clearly, I'm a crappy engineer and you have a better solution.
Go on, show me your proposed timings.

Get the hell off my hood before I start driving and fling you into traffic.

You can't light's red.
Well, when will it change?
	Tuesday.
• Major Reorganization of Sections in Chapter 4D
  - Similar subjects grouped together in adjacent sections or combined in one section
Guidance:

If it is necessary or desirable to prohibit certain pedestrian movements at a traffic control signal location, No Pedestrian Crossing (R9-3) signs (see Section 2B.51) should be used if it is not practical to provide a barrier or other physical feature to physically prevent the pedestrian movements.

Upgraded from Option to Guidance

- **R9-3 signs should be used to prohibit pedestrian movements at a signal location if it is not practical to provide a barrier or other physical feature**
Revised Definition of “Intersection” (reference to Section 1A.13)

- At a location controlled by a traffic signal, these areas shall also be a part of the intersection:
  - On approach, the area within crosswalk and/or beyond stop/yield line
  - On departure, area extending to far side of crosswalk
  - At median of divided highway if no stop or yield lines are designated
Standard: DRAFT

(DE Revision) The following meanings shall be given to highway traffic signal indications for vehicles and pedestrians:

2. Vehicular traffic facing a steady RED ARROW signal indication shall not enter the intersection to make the movement indicated by the arrow and, unless entering the intersection to make another movement permitted by another signal indication, shall stop at a clearly marked stop line; but if there is no stop line, before entering the crosswalk on the near side of the intersection; or if there is no crosswalk, then before entering the intersection; and shall remain stopped until a signal indication or other traffic control device permitting the movement indicated by such RED ARROW is displayed. When a traffic control device is in place permitting a turn on a steady RED ARROW signal indication, vehicular traffic facing a steady RED ARROW signal indication is permitted to enter the intersection to make the movement indicated by the arrow signal indication, after stopping. The right to proceed with the turn shall be limited to the direction indicated by the arrow and shall be subject to the rules applicable after making a stop at a STOP sign. Pursuant to Delaware Code, Title 21, Chapter 41, Subchapter II, §4108, right turns are not permitted on a steady RED ARROW signal indication. Therefore, traffic control devices permitting turns on a steady RED ARROW shall not be used.

DE Revision:

- Traffic Control Devices permitting turns on steady red arrow shall not be used
Section 4D.04 – Meaning of Vehicular Signal Indications

Standard:
E. Flashing yellow signal indications shall have the following meanings:
   1. Vehicular traffic, on an approach to an intersection, facing a flashing CIRCULAR YELLOW signal indication is permitted to cautiously enter the intersection to proceed straight through or turn right or left or make a U-turn except as such movement is modified by lane-use signs, turn prohibition signs, lane markings, roadway design, separate turn signal indications, or other traffic control devices.

   Such vehicular traffic, including vehicles turning right or left or making a U-turn, shall yield the right-of-way to:
   (a) Pedestrians lawfully within an associated crosswalk, and
   (b) Other vehicles lawfully within the intersection.

Clarification of Standard – Flashing Yellow

• **Vehicles entering intersection on flashing yellow (circular or arrow) shall yield to:**
  - pedestrians lawfully within crosswalk
  - vehicles lawfully within intersection

• Previous standard: vehicles entering intersection on flashing yellow are permitted to proceed with caution
Clarification of Standard – Flashing Yellow (continued)

- **Vehicles turning left or making a U-turn on flashing yellow (circular or arrow) shall yield to other vehicles approaching from the opposite direction**

- Previous standard: vehicles entering intersection on flashing yellow are permitted to proceed with caution
Clarification of Standard – Flashing Yellow (continued)

• Pedestrians facing a flashing yellow signal are permitted to proceed across the roadway but must yield to vehicles lawfully within intersection
Standard:
E. Flashing yellow signal indications shall have the following meanings:

4. When a flashing CIRCULAR YELLOW signal indication(s) is displayed as a beacon (see Chapter 4L) to supplement another traffic control device, road users are notified that there is a need to pay extra attention to the message contained thereon or that the regulatory or warning requirements of the other traffic control device, which might not be applicable at all times, are currently applicable.

Clarification of Standard – Flashing Yellow (continued)

- A flashing circular yellow indication displayed as a beacon alerts road users of the need to pay extra attention to a traffic control device.

Note: Here, beacons do not supplement a TCD.

Railroad underpass along Casho Mill Rd

Old Capital Trail
Clarified of Standard - Flashing Red

- **Pedestrians facing a flashing red signal are permitted to proceed across the roadway but must yield to vehicles lawfully within intersection**
- Previously, no discussion of pedestrians at flashing red signals
33

Section 4D.04 – Meaning of Vehicular Signal Indications

Standard:
F. Flashing red signal indications shall have the following meanings:

4. When a flashing CIRCULAR RED signal indication(s) is displayed as a beacon (see Chapter 4L) to supplement another traffic control device, road users are notified that there is a need to pay extra attention to the message contained thereon or that the regulatory requirements of the other traffic control device, which might not be applicable at all times, are currently applicable. Use of this signal indication shall be limited to supplementing STOP (R1-1), DO NOT ENTER (R5-1), or WRONG WAY (R5-1a) signs, and to applications where compliance with the supplemented traffic control device requires a stop at a designated point.

Clarified of Standard - Flashing Red (continued)

• A flashing circular red indication displayed as a beacon shall be limited to use with STOP, DO NOT ENTER, WRONG WAY or other traffic control devices that require a stop

Alternating beacons not correct. But recently fixed....
Clarified of Standard - Flashing Red Signals (continued)

- Note: Flashing Red Arrows (FRA) are still allowed, however, Sections 4D.05 and 4D.17 impact how we can use them in Delaware...
New Standard for Steady Yellow Arrow Indication

- **A steady yellow arrow indication shall be displayed in the same direction as a flashing yellow or red arrow indication in the same signal face:**
  - When the flashing arrow indication is displayed as part of a steady mode operation, and
  - If the signal face will subsequently display a steady red signal indication.
Implication of New Standard for Steady Yellow Arrow Indication:

- Current FRA signals in DE (<40) no longer compliant with MUTCD
- No decision yet on how to proceed
- Possible actions:
  - Convert some to protected-only (especially where >45 mph)
  - Convert some/all to FYA (w/ steady yellow arrow)
  - Convert some/all to FRA (w/ steady yellow arrow)
New standard for transition out of permissive phase for e/p lefts:

- New language addresses “yellow trap”
  - Caused by lead-lag left turns
  - Also caused by certain preemption sequences
- If conditions are satisfied, a W25-1 or W25-3 sign shall be installed overhead

- Being resolved in DE with new preemption timing

Source: FHWA Signalized Intersection Guide
New standard for transition out of permissive phase for e/p lefts:

- New language addresses “yellow trap”
  - Caused by lead-lag left turns
  - Also caused by certain preemption sequences

- If conditions are satisfied, a W25-1 or W25-3 sign shall be installed overhead

- Being resolved in DE with new preemption timing

Source: Kittelson Associates, Inc
New Standards

- **Specific prohibition of:**
  - **Flashing green signal indications**
  - **Vehicular countdown displays**
  - **Strobes within or adjacent to signal indications**

Standard:

D. A flashing green signal indication has no meaning and shall not be used.

Letters or numbers (including those associated with countdown displays) shall not be displayed as part of a vehicular signal indication.

Strobes shall not be used within or adjacent to any signal indication.

Except for the flashing signal indications and the pre-emption confirmation lights that are expressly allowed by the provisions of this Chapter, flashing displays shall not be used within or adjacent to any signal indications.
New Standard For U-Turn Arrows

- **Arrows shall be pointed:**
  - Vertically, or
  - Horizontally, or
  - Upward with slope at angle equal to angle of turn, or
  - U-turn
Kirkwood Highway at Green Valley Circle

Example of location where new U-turn signal would be appropriate
New Standard For 12-inch signal indications

- **12-inch indications shall be used for all new signal faces**
  - 6 exceptions for circular indications
  - Existing 8-inch circular indications are grandfathered for their remaining useful service life
Example of:
12” indication (red)
8” indication (yellow and green)
Within a signal face, two identical CIRCULAR RED or RED ARROW signal indications may be displayed immediately horizontally adjacent to each other in a vertical or horizontal signal face (see Figure 4D-2) for emphasis.

New Option

- Two identical red signal indications may be displayed horizontally for emphasis.
New Standard

- A minimum of **two** primary signal faces shall be used for the through movement if it exists, even if it is not the major movement.
Section 4D.11 – Number of Signal Faces on an Approach

Option:
02 Where a movement (or a certain lane or lanes) at the intersection never conflicts with any other signalized vehicular or pedestrian movement, a continuously-displayed single-section GREEN ARROW signal indication may be used to inform road users that the movement is free-flow and does not need to stop.

New Option

• For movements that never conflict with any other vehicular or pedestrian movement, a continuously-displayed single-section GREEN ARROW signal indication may be used to inform road users that the movement is free flow
Guidance:

If the posted or statutory speed limit or the 85th-percentile speed on an approach to a signalized location is 45 mph or higher, signal faces should be provided as follows for all new or reconstructed signal installations (see Figure 4D-3):

A. The minimum number and location of primary (non-supplemental) signal faces for through traffic should be provided in accordance with Table 4D-1.

New Guidance for New or Reconstructed Signals on Approach with Speeds of 45 mph or Higher:

- **Provide one overhead through signal per lane (minimum 2 signals)**
- See Table 4D-1
Section 4D.11 – Number of Signal Faces on an Approach

SR 58 at Continental Dr

>45 mph; 3 primary signal faces, as recommended

SR 2 at Linden

<45 mph; minimum of 2 primary signal faces, as recommended
Guidance:

If the posted or statutory speed limit or the 85th-percentile speed on an approach to a signalized location is 45 mph or higher, signal faces should be provided as follows for all new or reconstructed signal installations (see Figure 4D-3):

B. If the number of overhead primary signal faces for through traffic is equal to the number of through lanes on an approach, one overhead signal face should be located approximately over the center of each through lane.

New Guidance for New or Reconstructed Signals on Approach with Speeds of 45 mph or Higher (continued):

- On approaches with two or more through lanes, one signal face per through lane, centered over each through lane.

![Signal heads centered on through lanes, as recommended](SR 92 at Peachtree)
Guidance: **DRAFT**

07 (DE Revision) If the posted or statutory speed limit or the 85th-percentile speed on an approach to a signalized location is 45 mph or higher, signal faces should be provided as follows for all new or reconstructed signal installations (see Figure 4D-3):

C. Except for shared left-turn and right-turn signal faces, any primary signal face required by Sections 4D.17 through 4D.25 for an exclusive turn lane should be located overhead approximately over the center of each exclusive turn lane. *When two signal faces are used for a single left-turn lane, they should be positioned a minimum of 8 feet apart (see Section 4D.13) from each other, and both signal faces should be positioned within the extension of the lane lines.*

New Guidance for New or Reconstructed Signals on Approach with Speeds of 45 mph or Higher (continued):

- **Signal faces for an exclusive turn lane (except for shared turn signal faces) should be located over the center of the turn lane**

**DE Revision:**

- **When two signals are used for a single turn lane, they should be 8 feet apart and the pair of signals should be centered over the lane**

![Diagram of turn lane signals]
Section 4D.11 – Number of Signal Faces on an Approach

Signal heads approximately 8 feet apart, centered on turn lane

Elkton at Otts Chapel
Guidance:

If the posted or statutory speed limit or the 85th-percentile speed on an approach to a signalized location is 45 mph or higher, signal faces should be provided as follows for all new or reconstructed signal installations (see Figure 4D-3):

D. All primary signal faces should be located on the far side of the intersection.
E. In addition to the primary signal faces, one or more supplemental pole-mounted or overhead signal faces should be considered to provide added visibility for approaching traffic that is traveling behind large vehicles.
F. All signal faces should have backplates.

New Guidance for New or Reconstructed Signals on Approach with Speeds of 45 mph or Higher (continued):

- **All primary signal faces should be at the far side of intersection**
- **One or more supplemental faces should be considered**
- **All signal faces should have backplates**
Section 4D.11 – Number of Signal Faces on an Approach

**New Guidance for New or Reconstructed Signals on Approach with Speeds of 45 mph or Higher (continued):**

- **The guidance should also be considered for:**
  - Major urban or suburban arterial streets with ≥4 lanes
  - Other approaches with speeds of less than 45 mph
Option: DRAFT

07A (DE Revision) Backplates may be considered for use to signal faces in special circumstances, such as a safety countermeasure for specific types of crashes.

Support:

07B (DE Revision) DelDOT conducted a literature review on research that has been performed on the safety effect of adding signal backplates to signal faces. The literature review found a limited pool of data with significant variance in results. Other considerations associated with backplates include the cost of installation and maintenance, including the additional effort required to accommodate oversized vehicles through an intersection equipped with signal backplates.

DE Revision:

• Backplates may be considered for signal faces in special circumstances

• DelDOT conducted a literature review and found minimal data to support adding backplates to all signals faces especially considering the cost, maintenance, and effort
New Option

- **Optional yellow retroreflective strip (1-3 inches) to perimeter of signal backplate**
  - Increases signal conspicuity (especially at night)
  - Helps identify signal locations during power outages
New Guidance for New or Reconstructed Signal Installations

- **Signal faces displaying a CIRCULAR GREEN for a permissive left-turn movement should NOT be positioned overhead or post-mounted to the left/front of an exclusive left-turn lane.**
Major Reorganization in Sections 4D.17 – 4D.24

Left-Turn Movements

- 4D.17: General
- 4D.18: Permissive Only Mode
- 4D.19: Protected Only Mode
- 4D.20: Protected/Permissive Mode

Right-Turn Movements

- 4D.21: General
- 4D.22: Permissive Only Mode
- 4D.23: Protected Only Mode
- 4D.24: Protected/Permissive Mode

Mostly old information, but many new figures
Permissive-Only Left Turns

- Figure 4D-6 illustrates the optimal signal head positioning for a permissive-only left-turn movement.
- *Signals should be centered over through lanes*
Flashing Arrows for Left Turns

- New Standards and Figures to Clarify Requirements for Flashing Yellow Arrow (FYA) and Flashing Red Arrows (FRA)
- **New Standard: use of Solid Yellow Arrow** (discussed previously)
- While supplementary signs are not required, if used with a FRA, it shall be a LEFT TURN YIELD ON FLASHING RED ARROW AFTER STOP (R10-27)
Flashing Arrows for Left Turns

**Figure 4D-7. Typical Position and Arrangements of Separate Signal Faces with Flashing Yellow Arrow for Permissive Only Mode Left Turns**

**Figure 4D-8. Typical Position and Arrangements of Separate Signal Faces with Flashing Red Arrow for Permissive Only Mode and Protected/Permissive Mode Left Turns**

Note: A flashing red arrow controlling a left-turn movement may be used only when an engineering study determines that each and every vehicle must successively come to a full stop before making a permissive turn.
Flashing Arrows for Left Turns

Figure 4D-12. Typical Position and Arrangements of Separate Signal Faces with Flashing Yellow Arrow for Protected/Permissive Mode and Protected Only Mode Left Turns
Protected/Permissive Left Turns

Figure 4D-11 illustrates the optimal positioning for shared signal faces for Protected/Permissive left-turn

- The 5-section signal should be centered between through and left turn lane
- The green ball within the 5-section signal should not be positioned above the exclusive left turn lane
Protected-Only Left Turns

Standard:

06. A protected only mode left-turn movement that does not begin and terminate at the same time as the adjacent through movement shall not be provided on an approach unless an exclusive left-turn lane exists.

01. If a shared signal face is provided for a protected/permissive mode left turn, it shall meet the following requirements (see Figure 4D-11):

E. A protected/permissive shared signal face, regardless of where it is positioned and regardless of how many adjacent through signal faces are provided, shall always simultaneously display the same color of circular indication that the adjacent through signal face or faces display.

New Standards

• **Protected-only left turn mode shall not be used without an exclusive left-turn lane unless the approach is split-phased**

• **Circular indications must always simultaneously display the same color (no Dallas phasing)**
Protected-Only Left Turns

Standard:

If a separate left-turn signal face is provided for a protected only mode left turn, it shall meet the following requirements (see Figure 4D-10):

A. It shall be capable of displaying the following signal indications: steady left-turn RED ARROW, steady left-turn YELLOW ARROW, and left-turn GREEN ARROW. Only one of the three indications shall be displayed at any given time. A signal instruction sign shall not be required with this set of signal indications. If used, it shall be a LEFT ON GREEN ARROW ONLY (R10-5) sign (see Figure 2B-27).

New Standard

- A separate left-turn signal face for protected-only mode must now contain a left-turn RED ARROW
  - An older option to use CIRCULAR RED for protected left-turns has been deleted
Protected-Only Left Turns

• Figures 4D-9 and 4D-10 illustrate the optimal positioning for shared and separate signals for protected-only left turns.
Right Turns

- New Sections 4D.21 through 4D.24 (right turn signals) very similar to Sections 4D.17 through 4D.20 (left turn signals)
G. When the separate right-turn signal face is providing a message to stop and remain stopped, a steady right-turn RED ARROW signal indication shall be displayed if it is intended that right turns on red not be permitted (except when a traffic control device is in place permitting a turn on a steady RED ARROW signal indication) or a steady CIRCULAR RED signal indication shall be displayed if it is intended that right turns on red be permitted. Pursuant to Delaware Code, Title 21, Chapter 41, Subchapter II, §4108, right turns are not permitted on a steady RED ARROW signal indication. Therefore, traffic control devices permitting turns on a steady RED ARROW shall not be used.

Option:

01A (DE Revision) On state-maintained roads, in locations where right turns may be prohibited during special circumstances, a shared signal face may be used consisting of the following signal indications: a CIRCULAR GREEN, CIRCULAR YELLOW, CIRCULAR RED and right-turn RED ARROW. For additional emphasis, the NO TURN ON RED ARROW (R10-11-DE) sign may be used.

Delaware Revision:

• Traffic Control Devices permitting turns on steady red arrow shall not be used

• For added emphasis, the NO TURN ON RED ARROW (R10-11-DE) sign may be used
New Section and Standard

• For approaches without a through movement, all red signal indications for each signal shall be CIRCULAR RED.
New Figure 4D-20 (Sheets 1 through 3)

- Three sheets to show indications for approaches with:
  - No conflicting vehicular or pedestrian movements
  - Pedestrian or vehicular conflict with one turn movement
  - Pedestrian or vehicular conflicts with both turn movements
Layout of Signal Heads

• While the MUTCD provides new, improved figures showing various signal head arrangements, does not cover all situations

• Therefore, future DelDOT Traffic Design Manual will include:
  - 20 typical applications, covering most intersection configurations in DE
    o compliant with new MUTCD
    o consistent with DelDOT’s preferences, including use of two signal heads per movement
  - minimum lateral offset dimensions

• DRAFT figures (subject to revision) are shown in following pages

SR 24 at SR 5
Section 4D.26 – Yellow Change and Red Clearance Intervals

Standard:
03 The duration of the yellow change interval shall be determined using engineering practices.
06 When used, the duration of the red clearance interval shall be determined using engineering practices.

Guidance:
05 When indicated by the application of engineering practices, the yellow change interval should be followed by a red clearance interval to provide additional time before conflicting traffic movements, including pedestrians, are released.

• Durations shall be determined using engineering practices
  - Compliance date December 31, 2014 or when timing adjustments are made (whichever occurs first)
  - Guidance:
    - Yellow Change Interval: min 3 sec, max 6 sec
    - Red Clearance Interval: max 6 sec

• Current DelDOT practices:
  – Yellow Change Interval: Use ITE formula

  – Red Clearance Interval: typically 2 sec

\[
YCI = t + \frac{V}{2a}
\]

where:
- \(YCI\) = yellow change interval (s)
- \(t\) = perception-reaction time, 1 s
- \(V\) = posted speed limit, ft/s
- \(a\) = deceleration rate, 10 ft/s\(^2\)

might change
Guidance:  **DRAFT**

11 Except for traffic control signals interconnected with light rail transit systems, traffic control signals with railroad preemption or coordinated with flashing-light signal systems should be provided with a back-up power supply.

**Guidance:**

08A (DE Revision) During the transition into preemption control:

A. The pedestrian change interval should not be shortened or omitted.

**New Guidance**

- **A back-up power supply should be provided for signals with railroad preemption**

**Delaware Revision**

- **Should not omit or shorten ped change interval during preemption**

---

**SR 52 at Hillside**
Based on engineering study or engineering judgment, traffic control signals may be operated in the flashing mode on a scheduled basis during one or more periods of the day rather than operated continuously in the steady (stop-and-go) mode.

**Guidance:**

06A (DE Revision) Traffic control signals on state-maintained roads should not alternate operations between flashing mode and steady (stop-and-go) mode except in unique circumstances.

**New Option**

- With engineering judgment, traffic signals may be operated in flashing mode for one or more scheduled periods during the day

**Delaware Revision**

- Should not switch between steady and flash mode, except for unique situations
New Support

- References Section 2B.19 for recommended use of overhead signs at signalized intersections

Although unconventional, lane control signs may be overhead with ≤ 2 approach lanes; **prohibited overhead along approaches with ≥ 3 lanes**

SR 2 (Lincoln St) eastbound at SR 52
Section 4E.02 – Meaning of Pedestrian Signal Head Indications

Standard:

Pedestrian signal head indications shall have the following meanings:

B. A flashing UPRAISED HAND (symbolizing DONT WALK) signal indication means that a pedestrian shall not start to cross the roadway in the direction of the signal indication, but that any pedestrian who has already started to cross on a steady WALKING PERSON (symbolizing WALK) signal indication shall proceed to the far side of the traveled way of the street or highway, unless otherwise directed by a traffic control device to proceed only to the median of a divided highway or only to some other island or pedestrian refuge area.

Revised Definition

• **A flashing UPRAISED HAND (DON’T WALK) indication means:**
  - a pedestrian who has already started to cross shall proceed to the far curb
  - **unless directed to proceed only to the median or pedestrian refuge area**

• Signals must be timed so that pedestrians have enough time to cross entire roadway

• If time is only provided to cross to median, you **must** provide signs or signals to direct them accordingly (see Section 4E.06).
Revised Standard/Guidance

- **Overlaid pedestrian symbols are allowed**
- **If ped signal causes excessive glare in nighttime conditions, automatic dimming should be used**

---

**Standard:**
02 If a two-section pedestrian signal head is used, the UPRaised HAND (symbolizing DONT WALK) signal section shall be mounted directly above the WALKING PERSON (symbolizing WALK) signal section. If a one-section pedestrian signal head is used, the symbols shall be either overlaid upon each other or arranged side-by-side with the UPRaised HAND symbol to the left of the WALKING PERSON symbol, and a light source that can display each symbol independently shall be used.

**Guidance:**
10 If the pedestrian signal indication is so bright that it causes excessive glare in nighttime conditions, some form of automatic dimming should be used to reduce the brilliance of the signal indication.
Standard:

When the pedestrian signal heads associated with a crosswalk are displaying either a steady WALKING PERSON (symbolizing WALK) or a flashing UPRAISED HAND (symbolizing DONT WALK) signal indication, a steady or a flashing red signal indication shall be shown to any conflicting vehicular movement that is approaching the intersection or midblock location perpendicular or nearly perpendicular to the crosswalk.

Revised Standard

- **If a ped signal displays a steady WALKING PERSON or flashing UPRAISED HAND, a steady or flashing red signal indication must be shown to conflicting vehicles**
Standard:

A pedestrian change interval consisting of a flashing UPRAISED HAND (symbolizing DONT WALK) signal indication shall begin immediately following the WALKING PERSON (symbolizing WALK) signal indication. Following the pedestrian change interval, a buffer interval consisting of a steady UPRAISED HAND (symbolizing DONT WALK) signal indication shall be displayed for at least 3 seconds prior to the release of any conflicting vehicular movement. The sum of the time of the pedestrian change interval and the buffer interval shall not be less than the calculated pedestrian clearance time (see Paragraphs 7 through 16). The buffer interval shall not begin later than the beginning of the red clearance interval, if used.

Revised Standard

- **Requires a buffer interval (steady UPRAISED HAND of at least 3 sec) following the FDW prior to the release of the conflicting traffic**
- Previously, you could transition between the FDW and the steady DW at the end of the all red clearance interval

- This is an issue for DelDOT at intersections w/o countdown pedestrian signals due to DelDOT’s typical use of a 2 sec all red.
- Very difficult to program controllers to change pedestrian timing partially through yellow.
- **DelDOT systematically upgrading signals to include countdown ped signals.**
- Buffer interval may be part of calculated ped clearance time
Guidance:

Except as provided in Paragraph 8, the pedestrian clearance time should be sufficient to allow a pedestrian crossing in the crosswalk who left the curb or shoulder at the end of the WALKING PERSON (symbolizing WALK) signal indication to travel at a walking speed of 3.5 feet per second to at least the far side of the traveled way or to a median of sufficient width for pedestrians to wait.

Option:

A walking speed of up to 4 feet per second may be used to evaluate the sufficiency of the pedestrian clearance time at locations where an extended pushbutton press function has been installed to provide slower pedestrians an opportunity to request and receive a longer pedestrian clearance time. Passive pedestrian detection may also be used to automatically adjust the pedestrian clearance time based on the pedestrian’s actual walking speed or actual clearance of the crosswalk.

Revised Guidance/Option for Calculating Various Pedestrian Signal Intervals:

- The pedestrian clearance time should be calculated using a walking speed of 3.5 feet per second.  **was 4.0 fps**

- A walking speed of 4.0 fps may still be used if an extended button press feature or passive pedestrian detection is installed
New Guidance for Calculating Pedestrian Signal Intervals:

- **The sum of the walk interval and ped clearance time should allow a pedestrian walking at 3.0 fps to travel from ped detector (typically <10 ft in advance of curb) to far face of the curb**
Figure 4E-2. Pedestrian Intervals

“Zero” point of countdown display

Calculated pedestrian clearance time*** (see Section 4E.06)

3 seconds MIN.

Relationship to associated vehicular phase intervals:

- Yellow Change Interval = Buffer Interval
- Yellow Change Interval + Red Clearance Interval = Buffer Interval
- Part of Yellow Change Interval + Red Clearance Interval = Buffer Interval
- Red Clearance Interval = Buffer Interval
- Associated Green Interval extends beyond end of Buffer Interval

Legend:
- G = Green Interval
- Y = Yellow Change Interval (of at least 3 seconds)
- R = Red Clearance Interval
- Red = Red because conflicting traffic has been released

* The countdown display is optional for Pedestrian Change Intervals of 7 seconds or less.
** The Walk Interval may be reduced under some conditions (see Section 4E.06).
*** The Buffer Interval, which shall always be provided and displayed, may be used to help satisfy the calculated pedestrian clearance time, or may begin after the calculated pedestrian clearance time has ended.
Section 4E.06 – Pedestrian Intervals and Signal Phases

Option:

19. At intersections with high pedestrian volumes and high conflicting turning vehicle volumes, a brief leading pedestrian interval, during which an advance WALKING PERSON (symbolizing WALK) indication is displayed for the crosswalk while red indications continue to be displayed to parallel through and/or turning traffic, may be used to reduce conflicts between pedestrians and turning vehicles.

Guidance:

22. If a leading pedestrian interval is used, it should be at least 3 seconds in duration and should be timed to allow pedestrians to cross at least one lane of traffic or, in the case of a large corner radius, to travel far enough for pedestrians to establish their position ahead of the turning traffic before the turning traffic is released.

23. If a leading pedestrian interval is used, consideration should be given to prohibiting turns across the crosswalk during the leading pedestrian interval.

Support:

24. At intersections with pedestrian volumes that are so high that drivers have difficulty finding an opportunity to turn across the crosswalk, the duration of the green interval for a parallel concurrent vehicular movement is sometimes intentionally set to extend beyond the pedestrian clearance time to provide turning drivers additional green time to make their turns while the pedestrian signal head is displaying a steady UPRaised HAND (symbolizing DON'T WALK) signal indication after pedestrians have had time to complete their crossings.

New Option for Leading Ped Intervals

- A WALKING PERSON indication may be displayed for peds while red indications continue to be displayed for parallel and/or turning traffic

- The leading ped interval should be at least 3 seconds to allow pedestrians to cross one lane of traffic and establish position in crosswalk
Notice leading WALK indication while corresponding traffic signal remains on red

Most appropriate for locations with high pedestrian volumes (examples: Beaches, Wilmington, Newark)
Section 4E.07 – Countdown Pedestrian Signals

Standard:

All pedestrian signal heads used at crosswalks where the pedestrian change interval is more than 7 seconds shall include a pedestrian change interval countdown display in order to inform pedestrians of the number of seconds remaining in the pedestrian change interval.

New Standard

• If the pedestrian change interval is more than 7 seconds, a countdown display must be used
• No compliance date
• Can remain w/o countdown heads until ped heads replaced

i.e., the flashing Don’t Walk

i.e., almost everywhere

SR 2 at Linden
New Standards

- **The countdown shall be displayed simultaneously with a flashing UPRAISED HAND**
- **The countdown shall display “Zero” at the end of the pedestrian change interval**
- **The countdown display shall not be used during the all red phase**
New Guidance on Location of Pedestrian Pushbuttons

- Easier to reach
- Placed more consistently
- More obvious which crosswalk it applies to
- Consistent with potential APS upgrades

INCORRECT

CORRECT

SR 404 at E. Service Rd
Section 4E.08 – Pedestrian Detectors

Option: **DRAFT**

Pedestrian detectors may be pushbuttons or passive detection devices.

**Guidance:**

04 **(DE Revision)** If pedestrian pushbuttons are used, they should be capable of easy activation and conveniently located near each end of the crosswalks. Except as provided in Paragraphs 5 and 6, pedestrian pushbuttons should be located to meet all of the following criteria (see Figure 4E-3):

- **A.** Unobstructed and adjacent to a level all-weather surface to provide access from a wheelchair;
- **B.** Where there is an all-weather surface, a wheelchair accessible route from the pushbutton to the ramp;
- **C.** Between the edge of the crosswalk line (extended) farthest from the center of the intersection and the side of a curb ramp (if present), but not greater than 5 feet from said crosswalk line;
- **D.** Between 1.5 and 10 feet from the edge of the curb, shoulder, or pavement;
- **E.** With the face of the pushbutton parallel to the crosswalk to be used; and
- **F.** At a mounting height of approximately 3.5 feet, but no more than 4 feet, above the sidewalk.

**New Guidance on Location of Pedestrian Pushbuttons**

**Pedestrian pushbuttons should be:**

- **Unobstructed, adjacent to a level surface, with accessible route to curb ramp**
- **Min 1.5’, 10’ max from curb**
- **< 5’ from the crosswalk line farthest from the center of the intersection**
- **Mounted 42” to 48” above sidewalk, parallel to crosswalk**
DE Revision:

- Where there is a high probability of pushbutton pole being struck:
  - Should be placed as far as possible from road
  - Still within 10’ of curb/shoulder/pavement
  - Figure 4E-4 revised accordingly
New Guidance on Location of Ped Pushbuttons

- **Two pushbuttons on same corner should be min. 10’ apart or can be co-mounted on the same pole**
New Standard for Location of Ped Pushbuttons

- **Signs and Pushbutton location must make it obvious which crosswalk it applies to**

  - Educational sign
  - Arrow may be used to make it more obvious which crosswalk it applies to
  - Arrowhead should not be covered for this type of installation
Option: **DRAFT**

12A (DE Revision) At intersections on state-maintained roads where pedestrian pushbuttons are co-mounted on poles, physical arrows on the pushbuttons may be used instead of arrows on pedestrian pushbutton signs to indicate which crosswalk is actuated by each pedestrian pushbutton.

**DE Revision:**

- **If pushbuttons are co-mounted on the same pole, use arrows on the pushbuttons not signs**

Single Educational Sign used for both pushbuttons (w/o arrow)

Arrow stickers Required

Walker at Saulsbury
Guidance on Accessible Pedestrian Signals (APS) and Detectors Combined and Reorganized:

- 4E.09 – General
- 4E.10 – Location
- 4E.11 – Walk Indications
- 4E.12 – Tactile Arrows and Locator Tones
- 4E.13 – Extended Pushbutton Press Features

Support:

02 The primary technique that pedestrians who have visual disabilities use to cross streets at signalized locations is to initiate their crossing when they hear the traffic in front of them stop and the traffic alongside them begin to move, which often corresponds to the onset of the green interval. The existing environment is often not sufficient to provide the information that pedestrians who have visual disabilities need to cross a roadway at a signalized location.

- The MUTCD now acknowledges that “the existing environment is often not sufficient” to provide adequate info for pedestrians with visual disabilities

Complete reversal from old MUTCD!
Section 4E.10 – APS and Detectors - Location

Standard:

If two accessible pedestrian pushbuttons are placed less than 10 feet apart or on the same pole, each accessible pedestrian pushbutton shall be provided with the following features (see Sections 4E.11 through 4E.13):

A. A pushbutton locator tone,
B. A tactile arrow,
C. A speech walk message for the WALKING PERSON (symbolizing WALK) indication, and
D. A speech pushbutton information message.

New Standard

• **If 2 accessible ped pushbuttons are <10’ apart or on same pole, must have:**
  • Locator tone
  • Tactile arrow
  • Speech walk message for the WALKING PERSON indication
  • Speech pushbutton information message
Section 4E.11 – APS and Detectors - Walk Indications

New Standard

- **APS must have both audible and vibrotactile walk indications**
  
- **During the walk interval:**
  - **Audible**
    - percussive or speech walk message (only if two APS <10’ apart)
    - max volume of 100 dBA
  - **Vibrotactile** - arrow on pushbutton vibrates
Example of Accessible Pedestrian Signal (APS) Detector

Elkton Road at Apple
Standard:

01 To enable pedestrians who have visual disabilities to distinguish and locate the appropriate pushbutton at an accessible pedestrian signal location, pushbuttons shall clearly indicate by means of tactile arrows which crosswalk signal is actuated by each pushbutton. Tactile arrows shall be located on the pushbutton, have high visual contrast (light on dark or dark on light), and shall be aligned parallel to the direction of travel on the associated crosswalk.

02 An accessible pedestrian pushbutton shall incorporate a locator tone.

05 Pushbutton locator tones shall be deactivated when the traffic control signal is operating in a flashing mode. This requirement shall not apply to traffic control signals or pedestrian hybrid beacons that are activated from a flashing or dark mode to a stop-and-go mode by pedestrian actuations.

New Standard

• **APS pushbuttons shall have tactile arrows on pushbutton and a locator tone**

• **Locator tones must be deactivated when traffic signal is in flashing mode**
  • except signals activated from flashing mode by pushbutton (incl. HAWKS – see Chapter 4F)
New Option and Standards

- An extended pushbutton press may be used to activate increased crossing time, audible beacon, or speech message
  - <1 sec press: activates normal walk time + walk indication
  - >1 sec press: activates additional crossing time
- Shall use the R10-32P plaque wherever extended pushbuttons are used
NEW CHAPTER ON HYBRID BEACONS
Better known as...”HAWKS”
Section 4F.01– Application of Pedestrian Hybrid Beacons

New Chapter on Hybrid Beacons ("HAWKS")

- **Shall only be used:**
  - at marked crosswalks
  - with signs and pavement markings

Standard:

If used, pedestrian hybrid beacons shall be used in conjunction with signs and pavement markings to warn and control traffic at locations where pedestrians enter or cross a street or highway. A pedestrian hybrid beacon shall only be installed at a marked crosswalk.
Guidance:

If a traffic control signal is not justified under the signal warrants of Chapter 4C and if gaps in traffic are not adequate to permit pedestrians to cross, or if the speed for vehicles approaching on the major street is too high to permit pedestrians to cross, or if pedestrian delay is excessive, the need for a pedestrian hybrid beacon should be considered on the basis of an engineering study that considers major-street volumes, speeds, widths, and gaps in conjunction with pedestrian volumes, walking speeds, and delay.

- **HAWKS should be considered when:**
  - Signal Warrants not met (Chapter 4C)
  - Gaps in traffic are not adequate,
  - Speed of vehicles approaching is too high,
  - or, Pedestrian delay is excessive

- **New curves provided, similar to volume warrant curves in Chapter 4C (see Figures 4F-1 and 4F-2 next Slide)**
Section 4F.01– Application of Pedestrian Hybrid Beacons

Figure 4F-1. Guidelines for the Installation of Pedestrian Hybrid Beacons on Low-Speed Roadways

- Pedestrian Volume
- Crosswalk Length

Figure 4F-2. Guidelines for the Installation of Pedestrian Hybrid Beacons on High-Speed Roadways

- Major Street Volume
- Pedestrian Volume
Standard:

01 Except as otherwise provided in this Section, a pedestrian hybrid beacon shall meet the provisions of Chapters 4D and 4E.

02 A pedestrian hybrid beacon face shall consist of three signal sections, with a CIRCULAR YELLOW signal indication centered below two horizontally aligned CIRCULAR RED signal indications (see Figure 4F-3).

- A pedestrian hybrid beacon face shall consist of two CIRCULAR RED signal indications above a CIRCULAR YELLOW signal indication

Ada County Highway District, Idaho
Section 4F.02– Design of Pedestrian Hybrid Beacons

Standard:

When an engineering study finds that installation of a pedestrian hybrid beacon is justified, then:

A. At least two pedestrian hybrid beacon faces shall be installed for each approach of the major street,
B. A stop line shall be installed for each approach to the crosswalk,
C. A pedestrian signal head conforming to the provisions set forth in Chapter 4E shall be installed at each end of the marked crosswalk, and
D. The pedestrian hybrid beacon shall be pedestrian actuated.

Minimum Requirements

- Pedestrian signal head and pushbutton (not in view)
- Two beacon faces
- Stop line
- Mounted adjacent to beacon
Section 4F.02—Design of Pedestrian Hybrid Beacons

Guidance:

When an engineering study finds that installation of a pedestrian hybrid beacon is justified, then:

A. The pedestrian hybrid beacon should be installed at least 100 feet from side streets or driveways that are controlled by STOP or YIELD signs,

B. Parking and other sight obstructions should be prohibited for at least 100 feet in advance of and at least 20 feet beyond the marked crosswalk, or site accommodations should be made through curb extensions or other techniques to provide adequate sight distance,

C. The installation should include suitable standard signs and pavement markings, and

D. If installed within a signal system, the pedestrian hybrid beacon should be coordinated.

On approaches having posted or statutory speed limits or 85th-percentile speeds in excess of 35 mph and on approaches having traffic or operating conditions that would tend to obscure visibility of roadside hybrid beacon face locations, both of the minimum of two pedestrian hybrid beacon faces should be installed over the roadway.

On multi-lane approaches having a posted or statutory speed limits or 85th-percentile speeds of 35 mph or less, either a pedestrian hybrid beacon face should be installed on each side of the approach (if a median of sufficient width exists) or at least one of the pedestrian hybrid beacon faces should be installed over the roadway.

Additional Guidance:

- Speed > 35 mph: should be mounted overhead
- Speed < 35 mph: should either be mounted on both sides of approach (if median present) or at least one mounted overhead
- should be installed at least 100 feet from side streets or driveways controlled by STOP or YIELD signs (similar to guidance in Chapters 4C and 4D)
- Should include suitable signs and markings
- If part of coordinated system, should be coordinated
Section 4F.03– Operation of Pedestrian Hybrid Beacons

Standard:

01 Pedestrian hybrid beacon indications shall be dark (not illuminated) during periods between actuations.

02 Upon actuation by a pedestrian, a pedestrian hybrid beacon face shall display a flashing CIRCULAR yellow signal indication, followed by a steady CIRCULAR yellow signal indication, followed by both steady CIRCULAR RED signal indications during the pedestrian walk interval, followed by alternating flashing CIRCULAR RED signal indications during the pedestrian clearance interval (see Figure 4F-3). Upon termination of the pedestrian clearance interval, the pedestrian hybrid beacon faces shall revert to a dark (not illuminated) condition.

03 Except as provided in Paragraph 4, the pedestrian signal heads shall continue to display a steady UPRAISED HAND (symbolizing DONT WALK) signal indication when the pedestrian hybrid beacon faces are either dark or displaying flashing or steady CIRCULAR yellow signal indications. The pedestrian signal heads shall display a WALKING PERSON (symbolizing WALK) signal indication when the pedestrian hybrid beacon faces are displaying steady CIRCULAR RED signal indications. The pedestrian signal heads shall display a flashing UPRAISED HAND (symbolizing DONT WALK) signal indication when the pedestrian hybrid beacon faces are displaying alternating flashing CIRCULAR RED signal indications. Upon termination of the pedestrian clearance interval, the pedestrian signal heads shall revert to a steady UPRAISED HAND (symbolizing DONT WALK) signal indication.

Option:

04 Where the pedestrian hybrid beacon is installed adjacent to a roundabout to facilitate crossings by pedestrians with visual disabilities and an engineering study determines that pedestrians without visual disabilities can be allowed to cross the roadway without actuating the pedestrian hybrid beacon, the pedestrian signal heads may be dark (not illuminated) when the pedestrian hybrid beacon faces are dark.

Guidance:

05 The duration of the flashing yellow interval should be determined by engineering judgment.

Standard:

06 The duration of the steady yellow change interval shall be determined using engineering practices.

Guidance:

07 The steady yellow interval should have a minimum duration of 3 seconds and a maximum duration of 6 seconds (see Section 4D.26). The longer intervals should be reserved for use on approaches with higher speeds.

See next slides for graphics 😊
Section 4F.03– Operation of Pedestrian Hybrid Beacons

1. Until activated, the hybrid beacons remain dark and ped signals display steady DON’T WALK

2. When activated, beacons display a flashing yellow, while ped signals remain steady DON’T WALK

3. Beacons display a steady yellow while ped signals remain steady DON’T WALK
4. During ped walk interval, beacons display both steady red and ped signal displays steady WALK

5. During ped clearance interval, beacons alternate flashing red and ped signal flashes DON’T WALK

6. Upon termination of ped clearance interval, beacons revert to dark and ped signals display steady DON’T WALK
Section 4G.01 Application of Emergency-Vehicle Traffic Control Signals and Hybrid Beacons

Option:

03 An emergency-vehicle hybrid beacon may be installed instead of an emergency-vehicle traffic control signal under conditions described in Section 4G.04.

Section 4G.04 Emergency-Vehicle Hybrid Beacons

Standard:

01 Emergency-vehicle hybrid beacons shall be used only in conjunction with signs to warn and control traffic at an unsignalized location where emergency vehicles enter or cross a street or highway. Emergency-vehicle hybrid beacons shall be actuated only by authorized emergency or maintenance personnel.

14 At least two emergency-vehicle hybrid beacon faces shall be installed for each approach of the major street and a stop line shall be installed for each approach of the major street.

New Option

- Hybrid beacons may be installed instead of an emergency-vehicle traffic control signal
- shall only be used where emergency vehicles enter or cross roadway
- At least 2 hybrid beacon faces shall be installed on each approach

DE Guidance:

- Existing signals OK until the end of useful life
- Anything more than routine maintenance ➔ upgrade

Aetna Fire Station along Old County Rd

Could be replaced with HAWK
New Standard for Operation of Emergency-Vehicle Hybrid Beacons

- Similar to pedestrian HAWK
- Solid red phase optional
  (not shown in figure)

Standard:
Upon actuation by authorized emergency personnel, the emergency-vehicle hybrid beacon faces shall each display a flashing yellow signal indication, followed by a steady yellow change interval, prior to displaying two CIRCULAR RED signal indications in an alternating flashing array for a duration of time adequate for egress of the emergency vehicles. The alternating flashing red signal indications shall only be displayed when it is required that drivers on the major street stop and then proceed subject to the rules applicable after making a stop at a STOP sign. Upon termination of the flashing red signal indications, the emergency-vehicle hybrid beacons shall revert to a dark mode (no indications displayed) condition.
Revised Standards

- **12-inch signal indications now required**
- **At least two signal faces required**
- **A stop line is required for vehicles**
Section 4K.01  Traffic Signals at Toll Plazas

Standard:

01 Traffic control signals or devices that closely resemble traffic control signals that use red or green circular indications shall not be used at toll plazas to indicate the open or closed status of the toll plaza lanes.

Section 4K.02  Lane-Use Control Signals at or Near Toll Plazas

Standard:

01 Lane-use control signals used at toll plazas shall comply with the provisions of Chapter 4M except as otherwise provided in this Section.

02 At toll plazas with multiple lanes where one or more lanes is sometimes closed to traffic, a lane-use control signal shall be installed above the center of each toll plaza lane to indicate the open or closed status of the controlled lane.

New Chapter

- Red or green circular indications shall not be used to indicate open or closed status of toll lane
- Lane-use control signals shall be used to indicate open or closed status of toll lane

Note: I-95 Toll Plaza currently being upgraded
Chapter 4K– HIGHWAY TRAFFIC SIGNALS AT TOLL PLAZAS

**INCORRECT**

SR 1 – N. Dover Plaza

**CORRECT**

NJ Turnpike?
**Section 4K.03– Warning Beacons at Toll Plazas**

**Standard:**

01 Warning Beacons used at toll plazas shall comply with the provisions of Chapter 4L except as otherwise provided in this Section.

**Guidance:**

02 Warning Beacons, if used with a toll plaza canopy sign (see Section 2F.16) to assist drivers of such vehicles in locating the dedicated ETC Account-Only lane(s), should be installed in a manner such that the beacons are distinctly separate from the lane-use control signals (see Section 4M.01) for the toll plaza lane.

**Option:**

03 Warning Beacons that are mounted on toll plaza islands, behind impact attenuators in front of toll plaza islands, and/or on toll booth pylons (ramparts) to identify them as objects in the roadway may be mounted at a height that is appropriate for viewing in a toll plaza context, even if that height is lower than the normal minimum of 8 feet above the pavement.

- **Use of Warning Beacons shall comply with Chapter 4L**
- Warning Beacons mounted on toll plaza islands may be mounted at a height below the normal minimum of 8 feet above the pavement
- **Warning Beacons used with toll plaza canopy signs should be distinctly separate from lane-use control signals**

*OK to use flashing yellow for E-ZPass*

*I-95 - Newark*
Standard:
05 If two horizontally aligned red signal indications are used on an approach for an Intersection Control Beacon, they shall be flashed simultaneously to avoid being confused with grade crossing flashing-light signals. If two vertically aligned red signal indications are used on an approach for an Intersection Control Beacon, they shall be flashed alternately.

Revised Standard

- **If two red signal beacons are aligned horizontally, they shall be flashed simultaneously**
- **If two red signal beacons are aligned vertically, they shall be flashed alternately**

[Image of intersection with beacons showing horizontal and vertical flashing]
Section 4N – In-Roadway Lights

Standard:

02A (DE Revision) Due to prior poor performance of in-roadway lighting within Delaware, in-roadway lighting on state-maintained roads shall only be permitted with DelDOT Traffic approval.

DE Revision

• In-roadway lights only permitted on state maintained roads with DelDOT Traffic approval
