# Bloomsbury Site Plan

This site plan includes all the identified features of the Bloomsbury house site, together with some conjectural locations of original features.

A probable house location in the northeast corner of the site is indicated by several clues: a burnt patch that may have been the fireplace location; a relative lack of features inside the outline; the presence of blue beads in the topsoil in the vicinity of four corners. A second building, closer to the western well, may have been the earlier house that was associated with that well. Neither structure stood the entire time when the site was occupied, because features inside the spaces would have been dug in the open ground. A probable wash house is likewise indicated by an area devoid of features. Fence lines are suggested by linear clusters of postmolds.
