

NOISE ANALYSIS

301 US 301 Project Development

Noise Analysis

Federal Noise Regulations

The Federal Highway Administration (FHWA) has issued guidelines for noise evaluation as established in Title 23 of the Code of Federal Regulations (CFR) Part 772, Procedures for Abatement of Highway Traffic Noise and Construction Noise. Highway traffic noise studies, noise abatement procedures, coordination requirements and design noise levels in CFR Part 772 constitute the noise standards mandated by 23 U.S.C. 109(i). Design noise levels for various types of activity (land use) categories are summarized in the table below.

FHWA Noise Abatement iteria Activity Relationships	Activity Category	Design Noise Level Leq(h)	Description of Activity Category
	А	57 dBA (Exterior)	Land on which serenity and quiet are of extraordinary significance and serve an important public need, and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
	В	67 dBA (Exterior)	Residences, motels, hotels, schools, churches, libraries, hospitals, picnic areas, recreation areas, playgrounds, active sports areas, and parks.
	С	72 dBA (Exterior)	Developed lands, properties or activities not included in categories A and B above.
	D	-	Undeveloped lands.
	E	52 dBA (Interior)	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals and auditoriums.

Outline of Noise Analysis Procedures

- 1. Identify Noise-Sensitive Land Uses
- 2. Determine Existing Noise Levels
- 3. Compare Computed and Measured Noise Levels
- 4. Predict Design-Year Noise Levels
- 5. Project Noise Impacts
- 6. Assess Mitigation Measures

Analysis Procedures and Methodology This analysis was conducted in accordance with standard FHWA guidelines and current DelDOT procedures and policies. The analysis began with the determination of existing noise levels along the project corridor in order to

assess the traffic noise contributions on the neighboring noise sensitive areas. Future proposed design year 2030 alternatives noise calculations and predictions were performed using FHWA-approved methods. The noise predictions were performed with the FHWA Traffic Noise Model (TNM) version 2.5 (FHWA-PD-96-009). The model incorporates vehicle noise emission levels, updated for modern vehicle classification, traffic speed and traffic volume, sound propagation factors from atmospheric absorption, divergence, intervening ground, intervening barriers, intervening rows of buildings and areas of heavy vegetation.

A comparison of predicted existing and future noise levels, including the No-Build Alternative and retained alternatives is shown. Predicted noise levels were calculated to 0.1 dBA and then rounded to the nearest whole number.

Predicted noise levels shown are averaged over a 1-hour time period, as per FHWA/DelDOT policy, and are for traffic conditions that generate the highest overall noise levels. Loudest-hour noise conditions typically occur when traffic flow on a roadway is at a sustainable high volume, LOS D/E, allowing for the greatest number of vehicles to travel at high speeds

Also shown is an impact and mitigation analysis for each community.

DelDOT's Noise Abatement Policy

- DelDOT noise policy states that noise impact is assessed and mitigation is to be considered when either of the following conditions is satisfied:
 - Predicted design-year noise levels approach (defined as 1 dBA less) or exceed the FHWA noise abatement criteria, i.e. for Category B, a design-year noise level of 67 dBA or
 - An increase of 10 dBA or greater over existing conditions
- DelDOT noise policy for mitigation requires that:
- Noise mitigation be effective, i.e. 5 dBA or greater noise reduction goal for impacted receptors and
- > Noise mitigation be reasonable and feasible, not causing additional social, economic or environmental concerns and
- Noise mitigation be cost-effective, i.e. Cost not to exceed \$20,000 per benefitted residence
- efitted residence is one that receives a noise reduction of at least 3 dBA, regardless of impact status

US 301 Noise Analysis

- > All impacts within the US 301 Study Area are defined as Category B under the FHWA Noise Abatement Criteria > Category B receptors are residences, motels, hotels, schools, churches, libraries, hospitals, picnic areas, recreation areas, playgrounds, active sports areas, and parks
- ▶ Noise impacts to Category B receptors occur with a traffic noise level equal to or greater than 66 dBA or an increase over existing noise levels equal to or greater than 10 dBA

Preliminary Noise Results Communities NOT Impacted per FHWA Criteria

- Generally, communities that are at a distance greater than 800 feet from new US 301 or 400 feet from the Spur Road are NOT impacted under the FHWA Noise Regulations and DelDOT's Noise Policy:
 - Estates at St. Anne's - Chesterfield **Chestnut Grove** Parkside - Post & Rail Farms Bohemia Mill Pond - Summit Farms - Westside Hunt
- Back Creek - Crystal Run Farms - Dickerson Farms - Fox Hunter Crossing - Summit Pond - Villages at Fairway Farms - Mount Hope
- The following communities are less than 800 feet from new US 301 or less than 400 feet from the Spur Road but are NOT impacted per FHWA Noise Regulations and DelDOT's Noise Policy : - The Legends - Matapeake - Airmont - Springmill (Armstrong Corner Interchange Option 1)
- This does not mean the communities will not notice an increase in noise levels, it means the increase does not meet federal criteria
- Results are preliminary, as the Alternatives Retained continue to be refined in efforts to minimize impacts

Communities Impacted per FHWA Criteria

• The following communities are impacted under FHWA Noise Regulations and DelDOT's Noise Policy (approved by FHWA):

- Southridge	- Chesapeake Meadow	- Lea Eara Farms	- Grande View Farms
(All Alts. but YELLOW)	(All Alts. but YELLOW)	(BROWN North only)	(YELLOW & PURPLE+Spur)
- Middletown Village	- Summit Bridge Farms	- Residences on Boyds Corner Road,	- Asbury Chase I & II
(All alts.)	(All Alts. but BROWN North)	east of Mt. Pleasant	(YELLOW & PURPLE+Spur)
- Ratledge Road	- Midland Farms	(YELLOW)	
(Green North Only)	(Green+Spur and Purple+Spu	ır)	

• Noise mitigation is not feasible (because of other roads like Boyds Corner Rd, US 13, or SR 1 or need to provide access) or not cost-effective (because of the cost of noise walls) for the following communities:

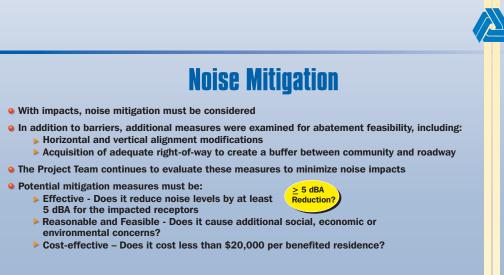

- . Middletown Village (east side) - YELLOW Alternative - walls (north side) – ALL Alternatives except BROWN North - walls YELLOW Alternative - Boyds Corner Road - property access YELLOW & PURPLE + Spur Alternatives - US 13, SR 1, Boyds Corner Road - walls bury Chase I & II -YELLOW & PURPLE + Spur Alternatives - US 13, SR 1, Boyds Corner Road - walls

- In addition to providing visual benefits to communities, the earth berms would also eliminate the projected noise impact under federal criteria for the following communities:
- Middletown Village (west side) - Chesapeake Meadow
 - Summit Bridge Farms (west and south sides) Ratledge Road
- Additional communities that would benefit from proposed earth berms: - Springmill

January 2007

Visual Screening - Earth Berms

- Earth berms to screen communities DeIDOT is proposing earth berms, where feasible and prudent, to provide visual screening between adjacent communities and new roadways
 - Lea Eara Farms - Southridge

Noise Mitigation Summary

• The noise impacts to the above communities were considered by DelDOT in the detailed evaluation of the Retained Alternatives and in making an informed decision regarding a
